Thread: [Problem with sending HTML email from Python](#)

SIM-4378207 - March 19, 2020, 9:14 am

Hello,

This is the code I am using: <https://pastebin.com/GJQTm7eA>

I want to put the subject in the text but as every email has different subject I get them from a spreadsheet. I cannot get the subject from the spreadsheet in the HTML version tho.

Anybody has any idea how to do it? In the pastebin is the latest version I came with, but it is buggy.

When it sends an email there is blank line between html and the subject and between the subject and html2

What is the solution you found?

Please don't destroy site content via the edit feature. If people continue to do that, further restrictions could be a result.

My bad.

Old code:

```
Code html = """\n<html>\n<head></head>\n<body>\n<p>Hello,<br>\n    I am aaaa and I represent aaaaa<br>\n    We are a aaaa site for aaaaaaa.<br>\n    We would like to collaborate</p>\n</body>\n</html>\n"""
```

```
html2 = """\n<html>\n<head></head>
```

```
<body>
  <p>. Please get back to us
</p>
</body>
</html>
''''
```

```
html = html + all_subjects[idx] + html2
```

Working code:

```
Code html = '''Hello,<br>
  I am aaaa and I represent aaaaa<br>
  We are a aaaa site for aaaaaaa.<br>
  We would like to collaborate for '''
```

```
html2 = '''<html>Please get back to us
</html>'''
```

```
html = html + all_subjects[idx] + html2
```

The head and the body from the html were ruining it. I removed them as I don't really need them, this is a simple email. I just needed to put my signature in there.
