Thread: [Networking Question - Override Dns Using Internal Dns ?](#)

yamycook - March 28, 2020, 2:43 am

I dont know if I ask this correctly , but bare with me .

I run XAMP on my personal Home Server and want to Forward or Proxying trough tunneling the visitor to example.com when they visit my ip.

Example.com is a fake domain that normally can be accessed on LOCALHOST (from server only - from what I set in xamp settings).

Example: My xamp ip is 1.1.1.1 . Visitor visits 1.1.1.1 and only sees my ip as the website adress.

I want that when visitor that visits my external ip 1.1.1.1 to be redirected to a domain I host for my xamp. Ex: domain.com .

I know people can access my own example.com domain that I host if I use no-ip.com , but I need to redirect everyone that visits the ip 1.1.1.1 to automaticly see the fake domain.com as the adress.

Basicly , in one sentence ITs just simple visit public Ip that gets redirected internal to xamp showing example.com .

Anyone know how to do this ? Thankyou

I don't see your request, BE CAREFUL I HAVE IMPOSTERS!

Make sure you add tim.freelancer don't just search "bandors" you will see ten people claiming to be ME!

Always PM me after you add me :D
