Thread: [RATs not working \(DNS works fine\)](#)

Enclave - March 28, 2020, 9:36 pm

Hello everyone,

So i got various android RATs , port forwarded (i checked ports are visible), used no ip , but when i try to open the servers on my own personal phone, doesn't work ! (with Spymax it works but only if i use my local adress)
how should i solve that ?

thanks in advance

Obistone - March 28, 2020, 10:07 pm

You know if you don't try to RAT you won't have problems with RAtIng.

If you can't answer the question try not replying.
i know how to RAT , this is the first time that occurs to me , its weird since everything seems okay with DNS and the RAT itself in local.

Thanks for your answer , i'm not used to windows, lets take an example of Ahmyth RAT :

-I downloaded java , downloaded ahmyth from github , port forwarded , when i go to canyouseeme website, it shows up : Success: I can see your service on xxxxxxxx on port (xxxx)

-apk builder is very easy ; just put ur ddns and port i forwarded

, if i put the local ip and try on my own smartphone it will work
if i put the ddns and try nothing shows up, and that's the problem , how to fix this please ?

I have seen some of your other posts and I see that you have good knowledge in this scene

Why should we avoid using NO-IP and what alternative would you recommend

Hi , i used ngrok and it works just fine , but the problem is, whenever i close it it changes the port , and therefore i could not connect to the server again (so its a one time hack) how to fix that ?
