Thread: [Free DDOS Protected Mitigation System](#)

Pronouncer - April 8, 2020, 5:08 pm

Wondering if anyone would be intrested in a Free version of cloudflare.

Ofcourse it will be very basic and have no web panel as I cba to code it but I have been developing a setup that will act like cloudflare.

What u need is

a domain and a webhost that gives u an IP that works.

EG

Instead of hackforums.net
Your site should be hosted on
123.123.123.123

if ur code is not gay and doesn't use URL redirects like for an image being displayed as

```

```

and is done properly like

```

```

Your domain would be pointed to our server which will then handle everything, including URL re-write so your backend is not exposed, and all information will be parsed through our server for you

Then this service would work fine for you and give you 700gbp DDOS protection (Tested) and SQLI and XSS protection)

Just wondering if anyone would like to see this and have access to this or if I should just dump my script xD

Also layer 7 protection? Could be very interesting.

Bear - April 9, 2020, 10:55 am

I want to know as well if this will mitigate Layer 7 attacks? How resourceful would these servers need to be to handle all of this?

The servers we use have really mediocre specs but the config on them makes them amazing.
