Thread: [Is NJRat still viable?](#)

NickA123 - April 13, 2020, 1:10 am

Hello!

My names Nick, completely new to all of this. Just recently I learned how to abuse Steams "family share" feature. Managed to get into a account, and lets just say I bought a LOT of amazon giftcards on their PC while they were asleep. (\$500 worth, sold them on ebay and made a total of \$430 in my paypal) I'm afraid this was a one time thing and isn't going to repeatable,

This lead me into researching RAT's. Here's what I know so far,

Rats allow you to remotely access a PC. If you have a user install a file, they'll be infected. You can bind your rat using a crypter.

Here's the reason I posted here and joined this forum;

I was wondering if NJrat is still a good rat, and where I can install it. I was also wondering if there's any good paid/free crypters that anyone would recommend. (Feel free to DM if you own one, I'm totally down to buy it!) I know about spartan crypter, and I'm really leaning towards buying that. Would just like some advice from the pros.

I'm also interested in learning how to open a port on my router, allowing me to host a connection between infected people's computers. I'd also offer a monetary reward for anyone who can assist me. Live in my own home and have access to the routers password, can reset it, etc.

If anyone could give me any help or DM me that would be great! As soon as I have my port open, I've already prepared a YouTube channel. It's fully setup for SEO and I already got videos scheduled to upload, promoting a fake "FPS booster" that is essentially a fake optimization software. It's just a gui :) Traffic isn't going to be a issue for me. I can get so many installs. I actually used to sell a legitimate botting software. Pretty much just integrated a API from one of those SSM sites into a piece of software, and have a audience of about 3500 people.

Corruption - April 13, 2020, 2:58 am

Hey Nick, am Corruption.

First of all my advice to you, don't post about anything illegal you did/do on this forum.

Honestly, I haven't been around HF much to know what are the "good" crypters on the market at the moment. However you can find crypters on sale [here](#).

There are many options I would suggest you read some replies and reviews and see which is best for your needs.

Now about "NJrat" yes it still exists you can find copies of it on Github, even highly modified versions of the tool.

The golden question is "Is it still good to be used?" and I would say no. Although it does still does handle "okay?" if it doesn't have many connections.

The main issues with it are that recovery functions do not work on most up to date browsers, also it

lacks many of the futures that modern 2020 Remote Admin tools would have.

My suggestion for you would be to find something open source and stable on Github and use that. It would be much safer and if you have any programming skills you could modify it and make it the way you as a remote admin user would like.

You stated that you would like to open a port on your router. I would suggest you DO NOT do this. I'm guessing you would like to open a port on your router and make the remote server point back to your Internet Protocol address. This is a bad idea, if your goal is to stay private and be somewhat untraceable try getting a VPN with open port functionality and no logs & dns/ip leaks (Making the server point the IP/Port on of the vpn).

[You can find VPN & Hosting services here.](#)

It would be also in my suggestion to get a bulletproof domain and point the server to its DNS instead of the VPN IP/Port since vpn servers could change and you could lose all your remote clients. With a domain you can always go into DNS settings and update the IP address from there since server is pinging dns and dns pings to IP. With this method you would ensure no clients are disconnected or lost because of server to host connectivity issues.

Another option would be to buy your own offshore bulletproof vps server and make it into a vpn with open port and make the server point your vps.

It all depends on how much time and effort your trying to put into it.

I would talk about the "FPS booster" idea but... this is HF Imfo.

One thing I would say is you can mess around with YT but don't base off there. There are plenty of better ways to get traffic, you just need to be creative.

Good LUCK! ???

getmyshows - April 13, 2020, 11:52 am

Njrat is good, ur use quasarRat its also good.

there many tutorials.

wish u good luck :)

You really need to stop shitposting m8.

I have managed to come up on few of your posts and the lack of quality is very high.

Please don't give advice to people if you don't even understand the topic or the question of OP.

Here is a perfect example of your low quality reply. [Your Reply <----](#)

Your post/answer doesn't even match what OP was saying...???

Hey, Nick!

I think njrat is still good if you know what you're doing. If you know how to mess around with base64,

There's a lot you could learn. In my opinion i think using base64 is good when you want to challenge AVs.

By the way, I agree with Corruption on the Router Forwarding...bad idea bud.

Wish you luck, Pal.

Hahaha mate he wants to reach that "be able to PM" goal xD

You might be the first he PM and ask for help :P

finalexception - April 15, 2020, 4:38 pm

no bro styles rat 1000% better

donoharam - April 15, 2020, 6:27 pm

hello , my brother. Yes njrat work see .

i used it still today .

it hold all my slave fine .

no ban like other rat.... ??
