Thread: [\[Required\] Cloud VPS + cPanel](#)

eXceptional - April 16, 2020, 1:03 pm

I'm upgrading from a shared web hosting to the below-mentioned requirements so that I could get full access to some PHP extensions.

I've been with my current web hosting provider for almost 8+ years now.

Core Requirements: CPU: six cores

16 GB RAM

400 GB disk space

100% SSD disk space

UNLIMITED traffic

DDoS protection

Live support every day, 365 days a year via e-mail and telephone

IP address

Snapshots

Operating system requirement: CentOS 7

Administration Panel: cPanel/WHM

I would also need the option to upgrade disk space in the future if needed for an additional price.

Offer me the best monthly package you can.

You just hosting sites or what? That's waaaaay overkill for 1 site

I have multiple websites to host.

Being a web developer I also offer my clients cheap hosting where I don't give them the cPanel details but just add on the domains for them and manage myself.

Hmmm...

have you considered just purchasing a reseller plan for the client aspect?

Yes, I did consider but in the end, I have my own scripts running too.

I'm preferring to upgrade to just because I don't need restrictions. Getting my own VPS and cPanel license would obviously remove it.
