Which steps did you take so far? Have you tried google yet? Which part are you stuck at?

Charger - April 17, 2020, 2:59 pm

Install php

Install MySQL

Google pdo code

Copy pdo

Paste pdo

Bam

Yes I have tried google and found the codes I need to insert in page to get the functionality I am looking for but does have a clue of how to begin.

I have now received advice from Charger on softwares to install for this process. Let me try them now.

I found the following below on this website - <https://windows.php.net/download#php-7.4>. Did I download only the source code or both

PHP 7.4 (7.4.5)

Download source code [23.21MB]

Download tests package (phpt) [13.34MB]

Gerira - April 17, 2020, 7:00 pm

You need to provide more details

- 1) what do you want to accomplish?
- 2) what environment are you working on (win/linux)?
- 3) have you setup (installed and configured) the database?
- 4) have you installed php?

Hi mate. I don't understand very well what you really need.

If you need a client to connect to connect to a already running database you can use

- Navicat (Free version)

If you want to run the datebase on your local machine. I recommand you install XAMPP (includes: apache, php, mysql server + phpmyadmin)

After you install XAMPP. You can access phpmyadmin (localhost/phpmyadmin) and import your database.

ok! XAMPP will work for you.

this will install a mysql server and give you a client to connect to it.

Hello Mate

XAMPP installed watched some SQL beginner's tutorials but not confident.

Are you on skype just need a guide to assist me in real time whilst trying to insert new values in the DB. Can you be of help please?

wym. It's stupid easy

PHP Code

<?php

```
$servername = "localhost";
```

```
$username = "username";
```

```

$password = "password";
$dbname = "myDBPDO";

try {
    $conn = new PDO("mysql:host=$servername;dbname=$dbname", $username, $password);
    // set the PDO error mode to exception
    $conn->setAttribute(PDO::ATTR_ERRMODE, PDO::ERRMODE_EXCEPTION);
    $sql = "INSERT INTO MyGuests (firstname, lastname, email)
VALUES ('John', 'Doe', 'john@example.com')";
    // use exec() because no results are returned
    $conn->exec($sql);
    echo "New record created successfully";
}
catch(PDOException $e)
{
    echo $sql . "<br>" . $e->getMessage();
}

$conn = null;
?>

```

You should honestly pick up a book or start in on an online tutorial. What you're looking to do is elementary PHP. This sort of stuff is covered very early on in any structured learning material. If you have at least basic web development experience (HTML & CSS anyways), then [Practical PHP 7, MySQL 7, and MariaDB Website Databases](#) will have you doing what you're trying to learn now almost right away.

Saul - April 19, 2020, 5:40 pm

Simply Google it, or use Youtube where there are tons of awesome videos answering your question in the best way.
