Thread: [Issues with current build](#)

Sun Diego. - April 26, 2020, 5:27 am

Recently I started playing some games again and really think this build is not really working out for me anymore, especially the CPU.

Especially warzone with only 80fps bothers me as I want / need atleast 144fps.

Current build:

GIGABYTE Aorus Nvidia Geforce 1080 TI

Intel Xeon e3 - 1231 - v3 - cooled with BE Quiet Dark Rock 3 pro

2x SSD, 2x HDD

EVGA 650 GQ

Ram 16gb DDR3

Thanks

I think your CPU is a bottleneck

Yeah also thought about that.

Anything you can recommend?

Depend on your budget, i have i7-9700 and its great CPU, keep in mind that you need new mobo and ram as well

Could always look towards an AMD board, you could probably get a Ryzen 5 3600x, MSI B450 Tomohawk Max and 16GB DDR4 for under £400 i'd say

Never had an AMD but thought about it since Ryzen came out. Will look into this setup, thanks man.

No worries, if your budget is tight you can always look at a 2700/2700x or a 2600. Hit me up on discord if you need any advice :)
