Thread: [\[TUT\] \[2020\] How To Hack Android Devices Remotely](#)

ReverseZ - May 7, 2020, 5:16 pm

Welcome to another tutorial by ReverseZ. This time we will be checking out Ahmyth RAT. (android)
Follow these step by step instructions to know how to hack android phone remotely using Ahmyth RAT.

PHP Code

```
<?php
```

Step 1- Download Ahmyth RAT from the link above and make sure your antivirus is turned off.
By the way, you can also install it in kali linux by downloading the .
deb package from the same link above.

Note:- Download and Install JAVA JDK and JRE from oracle java site.
Ahmyth will not work without JAVA and you'll not be able to build apk.

PHP Code

```
<?php
```

Step 2- First things first, we need to create our malicious server part apk file,
that we need to send to our victim.

Open Ahmyth, Click on APK Builder button from the menu.

Now, Enter your IP Address and the Port number you want to use
to establish a connection with your victim with this malicious apk.

Note: – If your victim is on same wifi network as yours,
you need to enter the ip address that you get after entering ip config command in cmd and
if your victim is over the internet, you need to port forward in the router or
you can also port forward without a router using portmap.

Check the Bind With Another APK option checkbox if
you want to bind your malicious apk with any other app or apk file.

Sometimes binding with another apk makes your malicious apk file useless,
that's why I would recommend you this time, to not to bind apk with any other app.

So after entering IP Address and Port, you need to click on the Build button.

PHP Code

```
<?php
```

Step 3- Your malicious apk is ready.

You need to deliver and install this app in your victim's smartphone to hack them and
get a reverse connection.

PHP Code

<?php

Step 4 – In Victims window, you need to enter the port that you used while creating the apk file and click on the listen button. Now, it will start listening for incoming connections on that port.

When your victim, install and open the app you created.
You will get a reverse connection in Victim's tab in the menu.

And you have successfully compromised your victim's smartphone.

Just right click on Victim phone in the Victims tab and perform any action you desire.
