Thread: [Linking inside a iframe](#)

Geatzo - May 17, 2020, 11:10 am

So im trying to copy a site the site hs a side bar

<http://prntscr.com/siicq1>

i have copied the functions nd got the side bar to work but ive noticed he hs links at the top inside the sidebar which links to other pages

<http://prntscr.com/siidkm>

He uses code like this

PHP Code

```
<?php
<li class="menu-tab" onClick="membersTab('view=top_pokemon', 0); return false;">Top Pokémon</li>
```

I am trying to work out what page is it calling? can i edit these to link to my own pages i have been trying most of the day but when i change the onlink and link the text it just opens the page in a new tab every time and not inside the side bar

PHP Code

```
<?php
<li class="menu-tab" ><a href="rich.php">Your Text</a></li>
```

Ive also added

PHP Code

```
<?php
<base target="_parent">
```

but this does not work so i simply want to edit these links at the top to go to my own pages

Not php

Also, you can't. You'll need your links to call javascript that will then invoke an element in the iframe. An iframe is basically just a body element and contains everything.

Also, you can't. You'll need your links to call javascript that will then invoke an element in the iframe. An iframe is basically just a body element and contains everything.

PHP Code

```
<?php
<li class="menu-tab" onClick="membersTab('view=local_top_trainers', 0); return false;">
Local Top Trainers</li>
<li class="menu-tab" onClick="membersTab('view=top_richest', 0); return false;">Richest Users</li>
<li class="menu-tab" onClick="membersTab('view=top_pokemon', 0); return false;">Top Pokémon</li>
```

```
<li class="menu-tab" onClick="membersTab('view=top_clans', 0); return false;">Top Clans</li>
<li class="menu-tab-end menu-tab" onClick=
"membersTab('view=seasonal_top_trainers', 0); return false;">Seasonal Top Trainers</li>
```

These are his link so what element is he calling? So i can look inside his js file for each link

<li class="menu-tab" onClick="membersTab('view=top_richest', 0); return false;">Richest Users</li>
<li class="menu-tab" onClick="membersTab('view=top_pokemon', 0); return false;">Top Pokémon</
li>
<li class="menu-tab" onClick="membersTab('view=top_clans', 0); return false;">Top Clans</li>
<li class="menu-tab-end menu-tab" onClick=
"membersTab('view=seasonal_top_trainers', 0); return false;">Seasonal Top Trainers</li>
```

No. You have to select the iframe and then select the li element. Then you can do that element.click
These are his link so what element is he calling? So i can look inside his js file for each link

Geatzo - May 18, 2020, 7:49 am

i have just noticed he has all ready built a function to link the pages

<https://stackoverflow.com/questions/61871776/javascript-linking-inside-a-iframe>

can anyone tell me were the links are pointing to ?

here are my links

<https://pastebin.com/dYfqT1TK>

then this is the script

<https://pastebin.com/DQTe3vPq>

So it looks like to me its just adding .html to the end? the links work but says it cant fin the page so i need to build the pages one of the pages are ignore_list.html im guessing?

Mr. Krill - May 23, 2020, 4:24 pm

i was actually looking for something like this, perfect thank you!
