Thread: [Meterpreter session via secured capable connection?](#)

oachman - May 21, 2020, 7:08 am

Hello everyone! Please I need some help/help regarding the issue I am having while trying to do penetration testing to an organization that I want to work with, the organization asked me to tunnel their connection outside their office without setting anything in the organization's computer or network, they gave me team view access and asked me to use another means to tunnel their connections and upload and delete a file in their system to show them that I am capable of doing so, so I created meterpreter payload and uploaded it via team view in their system, I ran the payload but it didn't give me connection but when I download the same payload to another of my friend's computer that is not in the same network with mine, it give meterpreter session. Please, does anyone know what I should do to connect with the computer outside the organization and have meterpreter sessions? Any help is appreciated. Thanks
Oachman

Is this Windows? If so, are you sure AV didn't pick it up?
If not, maybe the port you are using is blocked?
Try harder.

oachman - May 21, 2020, 10:06 am

It's even window 7, I am not sure if it's antivirus because when I run the file, there was no antivirus warning.

So you want help to do a task which you should be able to do to get the job legitimately?

Just wondering. GL with the task.

If he/she had a hard time with that, I'd imagine they will have a hard time doing the job.
