Thread: [Bypass Snapchat 2-step Authentication?](#)

ghyhghyh - May 22, 2020, 4:10 pm

I have the email and password to a Snapchat account. I'd like to log in, although it wants me to verify my device through the account owners number or email address. Is there a way to either bypass this or somehow get the verification code it sends? I'm well aware that it'll log the owner out once I'm in.

100PercentNotAMobster - May 22, 2020, 5:00 pm

I'm new (so don't listen to me, I'm just here to feel helpful) but I'd say just get into his email or look at his phone if you know him. You can send a phishing link to get access to his email, but that'll only work if he's fucking retarded. A big company like snapchat probably won't offer you any easy work around, but what the hell do I know. What you can do is either, set up your own website (to make the website a LITTLE more legit) or host a website on a linux machine (probably kali) If you choose to host your own, it's going to look stupidly sketchy. His browser might even just not connect him. I've been told there are some ways to get that cool green lock symbol on your phishing website, but you'll have to do your own research on getting that authentication. Just know it won't be long until the company finds out you're a scam, and you'll want to protect your privacy (or go to jail). Get a VPN. After you've got a website, clone the snapchat login screen, so yours looks identical. (This will work on iphones and computer just the same, btw) Then send a phishing link. If you don't know what phishing is, you'll have to look up a youtube tutorial on all of this. There are ways to get his gmail, but it's not simple. If your target has six braincells, this won't work. At least not without like 30,000 tries, and by then he'll know something is up. The way (I've been told, remember I'm new and probably wrong about most things) hackers are successful with this kind of thing is sending out mass phishing links. (Like thousands) because one single person is 99.99% going to be smart enough to see past such a horeshit link. But phishing is kind of your only option unless you know him personally, and can just look at his iphone when he gets the text. Also just so you know, gmail contains a list of dates and places of who logged into there account. You can't disable it btw, and they'll be alerted if you try. Though to my knowledge, they can't see your ip address through that list, and can only see your mac address if you're using some Pakistani bootleg of gmail, and shitty insecure ipv6 that's puts your mac address in the header for some reason. That doesn't even apply if you've got a vpn.

One more thing:

I'm not familiar with hacking snapchat (cause I'm dumb remember), but could the only reason it's asking for this authentication be you are trying to login from an unknown device? If so, just get the guys MAC address, and spoof yours to match his. There's tons of youtube tutorials on that. Then you'll be logging with his computer (basically). If you live in another city, get a VPN, and set it to wherever he is (assuming snapchat cares) I don't know of any ways to find his mac address through the internet, unless he's in the same building as you. If that's the case, find out his local ip address, then arp him.

I'm assuming I know more than you but I might not. This might all have already crossed your mind. I don't know man, I'm new don't listen to me
