Thread: [\[VERY SIMPLE\] HOW TO LAG/CRASH MINECRAFT SERVER](#)

OxaByte - May 28, 2020, 8:16 am

This tutorial is only for educational purposes , Please dont use it to hurt anyone

A few things to note before reading:

Im quite confident that this doesn't work on larger minecraft servers with good protection

Like I said, I'm not to be held responsible for what you do with this guide

You need to be able to take damage in the server

I've only tested this on 1.14.4, not sure if it works on other versions

It doesn't always crash the server

Things you'll need:

A minecraft account

A hacked client with the cheat "Regen" Example is aristois

Common sense

Instructions

Once you have everything you need, launch minecraft with aristois

Join the target server

Take damage, it doesn't have to be a lot

Enable the regen hack

The server should start lagging, and possibly crash

Educational purposes yet you don't explain anything about how it works

"just enable this and it should start lagging"

Cut the disclaimer if you're not educating.

Yeah more details would be nice

This will not work on major servers.

Most likely only on small community servers, if in even them.
