Thread: [Any tips for bypassing proctored exam? Made a virus in Python that screenshots PC!](#)

The Blunt - June 7, 2020, 8:50 am

I have a proctored webcam exam. I made a python program that uses about 5-10% CPU and restarts when killed and only lives for 7 mins before resetting for network footprint reasons.

Anyone know how to make this more secure? It's still showing up in Activity Monitor on macOS as Python, which shouldn't alert the system. It's posting to a website every 1.1 seconds. I don't think they will see or disable this successfully, but how can I make it better? Paying \$ if you have experience with it and macOS. Doing it today at 8PM

have it make requests at random intervals to seem more human like.

eg: 1 request after 1.3 seconds, the 2nd request after 3.4 seconds, the 3rd request after 2.1 seconds, etc.

Good idea, but it needs to be at least 1.3 seconds so i'll do a range.

Couldn't screenshot the secure program. Is VGA splitting possible without being detected?

The Blunt - June 15, 2020, 11:47 am

Anyone? Using VGA splitter
