Thread: [Someone knowledgeable in C++ \(or just help\)](#)

Chasadilla - June 12, 2020, 7:47 pm

Hey there all. I'm interested in the new Valorant game and have a few questions about making game cheats.

First of all, completely unaware of any game hacking and still fairly new to coding - I know enough c++ to read basic programs and can write simple programs and am better at Java but I don't think its super helpful here.

Secondly, I am interesting in testing game cheats but don't want to get banned. (Well. Didnt. I'm already banned but I will bring that up next). I was wondering how I could go about testing code on Valorant without being banned. In CSGO you could disable AC but you can't disable Valorant and run the game as far as I know.

Thirdly, I would really like help in figuring out how to get "unbanned" or at least a way to appear unbanned - but I know this is probably the most work out of everything and would be incredibly difficult.

Lastly, I would really appreciate if someone could (help me) compile some code I have into an exe (a few errors and missing pieces but I think someone with more knowledge could point me in the right direction).

Posted this in C++ forum too hopefully that's cool.

Unfortunately "basic" C++ knowledge won't get you anywhere close to a working aimbot or wallhack for the new valorant game. Their fraud detection system is quite advanced. Unless you have multiple years of time to learn to get really good at C++, do not even bother trying to build working cheats for valorant or any new hyped game at all. Even if you are able to throw a couple of thousands of lines of code together to get a shitty wallhack going, they will detect and fix it in no time. Making all of your efforts vanish in no time.

To keep it short: Unless you are seriously really fuckin good at C or C++, do not even think about wasting your time with this.

Best regards,
Vox
