Thread: [BIP39 Bruteforce for accessing bitcoin wallets](#)

chaha0s - June 26, 2020, 10:58 am

New here.

My first try.

Read about bip 39 and wanted to know if I could use it somehow.

Wrote a python script to generate unique random 12 digit recovery key , enter and recover the wallet (and associate it to an email).

Tried 50 combinations.Found all wallets with \$0 balance.

I know there are many many combinations but just wanted to know if am I doing something wrong here?

Bruteforcing Bitcoin accounts generally is a silly idea. Anyone who's got half a brain will have their wallets properly protected, especially given the value of BTC now. There's probably a 1 in a million chance you will get one with any BTC in there, and even then, you might only get \$5 worth.

Get a job. lol
