Thread: [Visual Studio Compiling Errors \(Persistent\)](#)

draxyee - July 8, 2020, 8:20 am

Hi guys,

When I compile my program, the project that's attached to it always generates errors.

After compiling again, the errors go away and I can start the program.

Sometimes it won't let me compile until I've cleaned the project, and compiled it twice, it's a really weird process.

Anyone have any clue why this might be happening to me?

Best,
Draxyee

Just add the reference to system.net and you will be fine

.NET framework 4.8

The other project uses this:

iolaka - July 8, 2020, 1:07 pm

Code using System.Net;

Trolling or didn't read thread?

Anyways, for anyone who's curious, I fixed it!

Just had to change x64 debug to Any CPU and it was all fixed :)

draxyee - July 11, 2020, 6:18 am

Nevermind, it came back, even on Any CPU. Anyone have any ideas?

HFDone - July 11, 2020, 1:17 pm

add reference to System.dll and System.Net.dll to your project
