Thread: [Clients disappear after 5 days](#)

b1nary21 - July 8, 2020, 2:55 pm

Hi guys, could you guide me to understand this?

I use async rat, I have around 23 clients of which I supervise 2 every day, these 2 clients are in async and I also installed a keylogger that sends me their keystrokes every 1 hour

so 1 day ago these 2 clients stopped appearing in async I thought that maybe they really stopped connecting to their pcs but no, my keylogger keeps sending me their keystrokes, so they are connected

So I set a goal: which is to reach 100 clients but with that light stone in the way I must look for solutions

-Could you guide me to understand, why did this happen?

-Could you tell me how to avoid this?

-must I update my stub and send it to its memory periodically so that they don't go unnoticed?

Don't use fee & cracked public Rats, Buy a private Rat. You need to Keep re-fuding the rat 1-2 time everyweek and load on your target system.

anyway I'll keep reading the new comments

Those public rats have detected behaviour and they will keep getting detected by antivirus.

These 2 clients that disappeared, were already connected asynchronously, 1 of them did not use AV

However, they left, I use a crypter that leaves my chunk 1/26 undetectable

for shared crypters you need to update your clients very fast

im sure its from your crypter

check the crypter runtime on antis

Are you talking about 2 or 23?

2 bro

These 2 were the first since all this started, the others are still connected (I'm afraid they will soon disappear)

Thats mainly because defender removed/Detected it.

Rats are detected fast compared to other tools

Don't listen to others saying you have to buy a private rat to reach your goal, in fact you don't even need a crypter to reach it, you just have to find better ways to spread your rat, you'll be amazed how stupid people are.

But obviously using a crypter will get you to your goal faster but it's not necessary, it's up to you.

What better ways? The end goal is that the rat should be run on the computer. And If the antivirus will detect it, it will not work anymore.

I talked to OP, his file is detected by almost all AV including WD. He just needs to update his stub even 24h because he's using public crypter.

thanks mate

ropslide - July 13, 2020, 12:10 pm

AsyncRAT isn't really the way to go. If you want something professional look at other products.

Hans1987 - August 5, 2020, 8:38 am

Send me ur anydesk so i can fix it.

Marketplace - August 5, 2020, 8:39 am

ReFUD your rat on a weekly basis & use a stable one. Botnets are better.

Elijah - August 5, 2020, 8:53 am

Never seen a public crypter that can refud fully in the first place lol maybe 1hr after release

It depends on how many users are using the crypter and the coder skills .

My cypter stub latest update was on 29th of July, and it's still fud right now.

Fluxe - August 5, 2020, 10:26 am

deffo agree, but the more eyes on a project will always bring detection. my stub from jul3 is still fud but hasent been posted anywhere. Not sure why when I read public crypter I was thinking free.

b1nary21 - August 5, 2020, 6:41 pm

This is solved Months ago

jakoto10 - August 8, 2020, 12:55 am

When you say botnets are better, you suggest the best one by their names. Please which botnets should we use?

SIM-4772474 - August 9, 2020, 12:11 am

RATs are easily picked up by antiviruses
