Thread: [Username checker Update](#)

-Nerotic- - July 10, 2020, 7:50 am

This post is in regards to my other post. you can find it [HERE](#)

I got this completely working but now I'm trying to integrate a feature so I can upload a Txt file of names to check instead of manually checking I can PM my code because I don't want it public out there. but this will be released for Free when done :)

Difficult to help with out seeing the code but presuming you have a basic checker that sends a request you can use something like the below to go through a text file to get the names and then do a check each time

PHP Code

```
<?php  
nameList = "list.txt"
```

```
with open(nameList , 'r') as file:
```

```
    for name in file:
```

```
        #use the name variable here to send your request and do your checks
```

Here I'm not going to spoil you with the easy answer but here's what you want to do.

<https://stackabuse.com/read-a-file-line-by-line-in-python/>

so you read the lines and put them into a list. For example we will call said list "usernames"

We all love loops so use a for loop to iterate over that list.

From here your code should look like.

Code for name in usernames:

Code_to_check_name_here
