Thread: [How to access ip camera connected to the same network?](#)

superak - July 12, 2020, 1:18 am

Hi, I hope this is the correct section to post this question.

I have installed some ip cameras to my property and so I have the mac address, I can see the internal ip through my router page. To configure it, you need to register an account and move your managing device closer (android, pc, etc) to the camera, after that a sound will play to auto-recognize the camera and you will be connected with your smartphone or pc.

I would like to access it without make this configuration, so just connecting to the same network of the camera, I would like to access the images. I tried to write in my browser the internal ip of the camera, named IPC365, but no page is found. Also I tried to change the IPv4 of my network interface but nothing change.

How can I access them without any registration?

Thanks.

any application for IP scanner like (angeryipscanner) after detect the IP go to browser and access to the ip the it ask you for password usually

admin : admin or search for camera brand and find default user : pass . Like router access

admin : admin or search for camera brand and find default user : pass . Like router access sorry, which ip range should I choose for the scan with angryipscanner? I have already used it selecting a range starting from my ip but didn't find any. From my router I can see the devices having the internal ip 192.168.etc but not the public ip. So how should I do the search configuration? I tried also Shodan but didn't find the specific device using location filter. Thank you.

admin : admin or search for camera brand and find default user : pass . Like router access typing the ip directly in the browser doesn't connect to anything. It says unable to connect. Also trying this <https://www.youtube.com/watch?v=3VALtFWOwE&t=240s> changing the IPv4 but doesn't help.
