The Amazing Sinner - August 24, 2020, 11:12 pm

Hello fellow members reading this thread. Today we will take a look of tool called Sn1per.

Actually it includes many tools (nmap, Metasploit, WAFWOOF, nikto and other.)

1N3 has made amazing script for automation. So the tools automatically launch and interact with the information provided from other tools. Also a huge plus is that Sn1per can be installed on Docker.

enough talking.

Lets install it

Requirements: Computer running Linux (Kali Linux preferred) or host with Docker support (digital ocean for example)

This is tutorial for Kali Linux:

So open terminal and type:

Code git clone <https://github.com/1N3/Sn1per.git>

Then cd into the directory and type:

Code chmod +x install.sh

And now you can install it by typing:

Code ./install.sh

Then you can just type "sniper (ip or URL)" and it will start.

It will provide information from ssl certificate to open ports.

Also it will launch automatically Metasploit modules.

(If it can detect one that fits)

Thank you for reading my quick tutorial of Sn1per usage.
