Thread: [Detecting usernames of a RDP / VPS server](#)

Tyler Durden. - August 25, 2020, 12:38 am

Hi HF,

I am seeking someone who can help me solve this issue I am having.

I am trying to find current usernames / log-in's, for remote desktop servers.

I know this is possible by using tools such as RDP ForcerX 1.5, which have a 'Detector' tab, that discovers current and active users / usernames for open RDP servers.

I would love to find out how to do this through Kali Linux, batch scripting, or whatever is most suitable.

I tried the following command in CMD, but with no luck:

"wmic.exe /node:(computername or ip address) computersystem get username"

Any help is highly appreciated!

Thanks a lot!
