Thread: [Smtip Server Setup \(Mass email \)](#)

buddha168 - September 7, 2020, 2:48 am

I create smtp server. For desktop mailing softwares

FAQ

1.How many emails can i send in one day?

- The setup can handle mass email 89k to 100k a day on multi threading softwares.

2.Is there any limitation just like shared hosting?

- No hour limit.

3.Do we have a panel to monitor the cpu/disk usage?

- Yes, you can reboot your vps also.

4.What port are you using?

- We use different port to send emails to avoid email activity detection.

- Most vps provider monitor port 25.

5.What mailer can we use?

- Any desktop mailing softwares and scripts.

- Atomic Mail Sender, AMS 4.3, Sendblaster, Turbomailer and many more.

6.Do we have Inbox (POP Access)?

- No.but all incoming emails and bounce forward to any email you want.

7.Can we use any name before @domain.com?

- Any name before @ can be use as "FROM" same username and pass.

- The vps setup uses catch-all domain alias.

- This setting is good if your mailer support spinning syntax (#RANDOM#@domain.com)
every emails you sent will be unique and spf pass.

Example:

abc@domain.com

123@domain.com

anything@domain.com

8.Can inbox Gmail, Yahoo, CL?

- YES.

9.Does it work on Interspire?

- Yes using external smtp on IEM

10. Do you provide support how to use the smtp server setup?

- Yes

Please note: We are not responsible on any activity of our clients.

What you will get from our setup.

- Your smtp server details , hostname , username , pass , port
- Pdf File / video (Tutorial)
- Free desktop mailer (Gammadyne)
- Your vps panel
