Thread: [How to scan all urls on the website?](#)

rko4all - October 9, 2020, 9:13 am

Hello Guys ,

About a week ago , I uploaded a shell.php file on a website but I have lost the location in which I uploaded the file from . Is there a tool that can scan all urls on the website and find it for me ? I used nikto but no results .

Regards ,

AmineB - October 9, 2020, 9:23 am

The easiest way to get all the URLs of any website is to type “/sitemap.xml” at the end of the website URL

I'm pretty sure shell.php won't be a part of sitemap.xml

use bruteforce tools like Dirb , burpsuit but this will take a lot of time , you can use a second method by check google archives :

site:type here the site ; filetype:php ;

OR

site:type here the site ; filetype:php ; intitle:your shell title ; inurl:any word in your shell will help .

you better upload again xD

probably image folder or something u uploaded ur shell
do it again
