Thread: [Ahmyth is not connecting back](#)

IrisOP - October 12, 2020, 10:26 am

I am doing a test on WAN. So, I have got a port forwarding vpn. Ahmyth on kali linux builds the apk with the correct IP and port. But after installing it on android-x86 version 9 virtual machine, I never get the connection. On the other hand if I use msfvenom and msfconsole, I do get the connection. So, what is wrong with ahmyth? Why ahmyth won't connect back? Of course I am listening to the same port.

Ahmyth I never use, it drops connection and package name stays the same name "Ahmyth", all someone has to do is google ahmyth and know it is a RAT. Imagine the .apk getting extracted and investigated and your IP or NODDNS comes up, and ping the NODDNS and voila IP shows. I would drop Amyth and use something else that allows package name such as spymax v2 or something else. Good luck.

Keep in mind AhMyth has not been updated in a while.

I can't get it to bind, tried everything I can think of to do that. How did you manage it (Windows 10) I used all versions of java, different apk files, no spaces in file names and still get decompilation failed.

I used all versions of java, different apk files, no spaces in file names and still get decompilation failed.

Use an older version of apk, probably 2-3 years old. Newer or latest apk files are protected and

cannot be recompiled once payload is implemented. However, they do get de-compiled. And I did it on kali linux. Not sure about windows. But I think you will need something like apktool on windows to de-compile and re-compile. Apktool is available on linux, but don't know about windows. Pretty sure you will need something to de-compile and recompile the apk files on windows.

Anybody willing to share some knowledge why my ahmyth isn't connecting back to me from an android 9 virtual machine?
