How to Learn XAML

Visit these websites and study HTML:[w3schools](#)

[html.com](#)

Once you think you know HTML, visit these resources and learn the basics of XAML:[Microsoft Docs](#)
[\[Reading\]](#)

[YouTube](#) [\[Watching\]](#)

Now you're A-OK and ready to Google how to actually learn.

HTML uses tags for it's language and so does XAML. I had a mental block on understanding XAML until I got into HTML, then it all made sense to me.

i think it is more appropriate to learn xml rather than html as xaml is just an extension of xml.

For me a software language should remain a software language. I'm not a fan of WPF but like everyone else I should get into it ?, just for the performance brought by the GPU.

WPF is good for those having basic web-building skill. I still prefer the good old Winforms.

Personally I just use C++ winforms. I use C/C++ for everything and I haven't coded a single line in another language. You can make winforms look really nice if you follow some design patterns.

Addition to what Washi said, if you think WPF is easy then try to communicate between viewmodels without using MVVM Frameworks or violating MVVM rules then you understand what is going on, or you might took WPF as XAML only.
