Thread: [Veil backdoor](#)

SIM-4854828 - October 20, 2020, 8:03 am

Hi everyone,

I'm pretty good at kali linux but when it comes to programming I am a little bit lazy, so I need help, can anyone teach me here how we can change the code of the veil backdoor so that it can not be detected when it runs on the target machine ? Please ?

SIM-4854828 - October 21, 2020, 9:33 am

I need help, please anyone here who can teach me ?

1. No, no one is going to do this because of.....

2. This is probably not open source which means it'll need to be reversed which means.....

3. People are either not gonna bother and suggest to go for one that does what you want or make you pay them to make the changes.... And not for cheap either.

What do you mean by open source ? I can see the code inside the backdoor, I can change it but I don't know how ?

Do you have the source files of the backdoor? If its not coded in python or pulled from github directly the answer is almost 100% no.

It's not that easy, and no one's going to waste hours of their time recoding malware for some random kid who just wants to infect innocent people.

Learn programming or don't. I also recommend uninstalling Kali Linux.

Thanks for that, I think you can't do it, that is why you reply in this way.

Thanks a lot, as it pertains to kali linux, I can work very well with it, I am not going to uninstall it.

You're right, because I wouldn't be using public malware in the first place. I'd code my own.

I'm sure you have a successful career ahead of you.

Sitrep - October 23, 2020, 7:17 pm

Veil framework is outdated and known by all AV's today, you will need to obfuscate the payload to be successful with it.

Obfuscation can be done in many ways depending on "attack path" etc.

Kali Linux is nothing more than a portable toolbox for people who are already experienced penetration testers and computing professionals. It's not intended for beginners who are just looking for an easy road to hacking when one doesn't exist. There are no shortcuts. OP has Kali Linux installed when he doesn't even understand basic concepts such as how AVs work or how software works. And OP wants to hack and exploit machines, but he's too lazy to learn how to program. It's like wanting to become a professional athlete but being too lazy to even exercise. It doesn't work like that, unfortunately.
