Thread: [Automatically detect and add the visited URLs or type on the keyboard](#)

Astate - October 21, 2020, 2:47 am

??? Hi WORLD !...

I searched for a long time and I can not find anything, maybe because I did not know how to ask...
So I will explain to you...

I'm developing a keyloggers-style program that logs everything on my PC
CLIPBOARD, INPUT KEYS, SCREEN ETC...

I would like it to automatically detect and add the visited URLs or type on the keyboard in a list
The problem qque I have these URL detections ?

Tanks for your responces....

You can hook using the wireshark c# dll

Shadow_Cloud - October 21, 2020, 5:27 am

You could also get this via DNS queries if you know what process would be making the request?
Look at something like this :

<https://www.codeproject.com/Articles/16194/Intercept-and-Rewrite-DNS-Requests-Using-Regular-E>

Alternatively you could probably parse the logs for possible domains and check if a DNS entry exists for them? This kind of depends on whether you want to do this post processing or intercept these requests at runtime?
