Thread: [Using HTTP Header Options](#)

Oxycodone - October 23, 2020, 3:24 pm

So I've been having issues against a fortinet firewall / ssl vpn.

I can't get the damn python script to run with python 2 or python 3 for the cve

I'm attempting the fortios magic Back foot cve

I ended up using owasp zap to attack it. I never used owasp before but I was trying to I put my own header and run the script against it and I haven't succeeded when trying to run it in my browser. But when I read the HTML of the response body. It seems like it's working. Maybe I'm wrong.

I was wondering if anyone can show me the correct Header format for the CVE and a tutorial on using owasp zap to run the attack.

There's documentation on the CVE and everything. And tutorials For owasp. But i feel like I'm using the wrong header format or wrong header option.

Thank you.

I'm on my phone so I can't really post Any details more then this.
