Thread: [Amp Scripts \(DNS, NTP, LDAP, WSD, ARD\)](#)

Drilla - October 25, 2020, 9:58 am

Anyone got any advice on making these stronger? I am using lists I scanned from zmap and am only getting ~2gbps output for DNS on 9 Spoofing servers. Something is wrong and I have no idea. LDAP not much better either, 6gbps.

RyMXBL - October 25, 2020, 12:55 pm

Drilla, It really depends on what your server is capable of outputting truthfully, if your port speed/hardware isn't the best you wont see much results in your attacks regardless. Now you can filter your lists for dups, and better reply sizes, accomplishing larger attacks. If you need any help shoot me a PM and I got ya.

LionServers - October 26, 2020, 4:22 pm

CPU and port speed are significant for output. Also if you only have 2 gbps on 9 servers you should definitely change your script. Packets are also important in the script you should check codes of scripts.

I mean it still should output more. I think dstats are just heavily filtered now.

Yeah, dstats are generally filtering attacks and they don't show gbps exactly. If you want to see the real output you should monitor attacks with a network device. This is the easiest way.

I'd love to build a strong private one.
