Thread: [find the api url that Website Use](#)

armanmanos - November 24, 2020, 12:00 am

hi , i use social media growing website . this website offer some social media services .

this site have form that when fill it and pay the price , connect to an API (i`m sure the API is from another site) and process your order

i need to find what is the URL of API ?

i try to use Browser inspect elements but no success

is this any way to find and track it ?

thank u so much

Check "Network" tab, instead of "Inspector" and browse through the requests

Similar to inspect element, you can try viewing complete source code and inspecting any JS/HTML files that may be crafting the unique API URL

If its send via XHR there will be a call in the network section of your dev tools in your browser. From this you will see what kicked off the request (what js file)

Hi

You cant find API easly with inpsct you just cant
U can find it with headers with sending request
try to find section so u can send request

for example : fields , score something like that
and u can get the api if exist.

Check all recived and sending headers from whole website
and u got it with checking the fight place at right time.

tools u can use:

- burp
- live http headers
- tamper data

Good luck.
