Thread: [Word list generator for brute force passwords](#)

hackforumguy - November 25, 2020, 5:19 am

I couldn't find any online tools to make good word lists so I made my own.

Here it is if you want to use it.
[wordlist-generator.net](#)

Also one with more options here...
[wordlist-generator.com](#)

I am having some trouble with PHP memory limit being exceeded on bigger lists but I will try to fix it soon. Hope you find it useful!

i cant post links? ffs.

In kali, there is a tool in there that can create a wordlist with anything you need phone numbers, 519-000-0000 and goes all the way through or wordlist for passwords for certain person so it will ask you questions, fav food, dogs name things like that its call "Crunch" Look at it, really well made, if you need a wordlist i have some, somewhere on my serve i just have to find them. Crunch helped me get into many businesses when i owned my own pen testing company.

Thanks, I was looking at integrating CeWL to scrape websites but I will take a look at what crunch can do too :)

I agree with my colleague, skillful use of Crunch produces amazing results. Additionally, Kali includes many other tools dedicated to creating personalized dictionaries (the first example from the edge - Cewl - thanks to which you can "analyze" a specific site in terms of potential keywords based on the words on the page). In addition, on Github you will find a lot of scripts to create lists of passwords as well as gigabytes already generated.

P.S. As for links in posts, have you tried to use the embed link option?
