Thread: [DDoS / SSYN Flood Script](#)

**SteelBot** - December 2, 2020, 2:08 am

Hello,

is it possible AND strong enough to write a DDoS Script in NodeJS?

I want to create a cloud cluster script to manage single vps to attack a victim server.

Any ideas or comments to this?

Maybe some links with example scripts?

Thanks a lot!

You should check this out on github [/mlazarov/ddos-stress](#)

Is a simple npm package for DDosing.

You just add it with

Code `npm install -g ddos-stress`

and is pretty easy to use.

Code `var Stress = require('ddos-stress');`

// Create new instance of DDoS Stress

`var stress = new Stress();`

// Run stress on server

`stress.run('ip or url',10);`

Although, if you want to build it, you can take an idea from the package itself

[/blob/master/lib/ddos-stress.js](#)

Thanks for your reply.

I already try it, but for my perspective its not really strong, or?

I try it with 2 vps at the same time, nothing happend.. ;)

I don't know much about ddos attacks but I think you need to attack with more than one connection.

I think that is where a botnet comes in.

Without having a botnet to send many requests from you're only DOS attacking them theres no distributed part. DOS attacks dont have much power

**yess** - December 7, 2020, 5:15 pm

Can i learn something from you

I try it with 3 VPS, so small server systems.. i hoped thats better than "normal" Victim PC's.. or isnt it?

So i want to rent 5-6 VPS, install my NodeJS Bot, and lets attack.. than its cheap and hopefully strong.. what do you think? How many i need?

you need a botnet with thousands of slaves.
