Thread: [How to create a base64 data image url with a payload?](#)

AlphaRays - December 20, 2020, 10:26 am

Hey guy,

Code

If you decode above base64 image url, you will find that it has payload along with the image itself. My question is, how to make one like this. When i try to encode it back with some changes in the bhp payload, the image is simply being corrupted. I am sure this is not how it can be done. If somebody know some python script, or some write ups about it?

If somebody know some python script, or some write ups about it?

Have you tried getting a image, appending your php code then saving it as a normal image then encoding it through 'base64' default linux command?

I don't think actually base64 encoding it will work (If that's not what you're doing, I apologise)

* edit It's possible the code you see is EXIF data?
