Thread: [Optimal wordlists for RDP](#)

kingboyd - January 3, 2021, 9:49 am

I'm looking for a more optimised wordlist, going after default accounts. I created one myself, but it's small and I know there's better wordlists out there. None of the publicly available ones fit my needs. I'm willing to hack together my own, but want to go after default accounts. My wordlist looks like:

```
owner:owner
operations:operations
install:install
aspnet:aspnet
scanner:scanner
.
.
.
etc
```

I have a good automated setup which runs attacks against Administrator account and 200k password list. Success is low, and I know by going after non-admin and default accounts I'll have much higher success rate. What wordlists (account:password pairs) are people using?

hackxback - January 7, 2021, 2:44 pm

Code

<https://www.google.com/search?client=opera&q=password+list+for+rdp&sourceid=opera&ie=UTF-8&oe=UTF-8>

Using public wordlists will not be successful in most cases, as there i literally thousands of people/scripts trying it everyday. You need to somehow create your own list with your own little twist to it.

password list. Success is low, and I know by going after non-admin and default accounts I'll have much higher success rate. What wordlists (account:password pairs) are people using? That is too much.

Just change the keyword. Each letter
