Thread: [Not sure if this is the right place to ask..need help with finding silent url exploit](#)

b7vvvvvvvvvvvvvv - January 6, 2021, 12:42 am

I've got a pretty hefty budget currently from running a couple projects,

I've started doing social engineering tests on different companies that have paid me to do it for them.

My tools are a little inadequate for the type of work I'm doing so I am looking for someone to direct me to a marketplace for the type of tools I need or if they can program/make them for me.

I have 6k USD most in Ethereum and some in PayPal.

if I need more I can work to get it. I am really looking for some type of easier way to do the tasks I'm doing,

which is essentially sending an email simply put, i need silent URL exploit. I better way to tell which browser/if they aren't using a browser. and any other tools to gain remote access easily thru email. the current business that are hiring me are using the email system mail chimp and with some sort of thing that works with mail chimp called mail drill I'm just laying out excess information in case anyone has type of exploits made especially for my needs.

In desperate need for this type of thing so anyone feel free to input your advice or thoughts I'm all ears! ?

I'd prefer to be sent to a reputable marketplace for this and not someone I have to trust to make for me, unless they are pretty reputable.

hope I can get an answer or somethin, btw ik this is a new acc i made it last night when i was looking for this and i posted a reply to some thread askin the dude for his discord so i could ask him about diff exploits.

regards, b3x

Let's see how to un-F*** this text wall shall we?

First off Silent URL Exploit? You're joking right? sigh Fine, let me Explain..... this is not possible.

However you could edit the plain text on an HTML link and use a Flash, JS or other form of Exploit to download a payload before redirecting to your 100% true and Legit website. For instance jajjfwjrkaekka.com isn't legit, so I'd Edit, the plain text such you'd seen them if you clicked any form of button on a webpage ("New Reply button" = [hackforums.net/newreply.php?tid=6131746](#)) so when clicked the button would go to a fake bad page (jajjfwjrkaekka.com or [IPv4 Address here on port so and so] 127.0.0.1:9050 is tor) and would redirect to the real site so, let's say you used a fake PayPal Email and it redirected to jajjfwjrkaekka.com and then redirected to paypal.com this would be better than trying to host some garbage dedicated page. If they went through your page to paypal.com/[password reset.php or whatever] you'd have there login but again phishing isn't allowed and this is an Idea. I can't confirm it works but it's a basis to fix this garbage

bruh it is possible its called a drive by attack lol ? it's just hard to find and super expensive if you find someone supplying it. sigh

let me explain..... drive by attacks are when a computer's own trust in hardware devices or even software is used against it to quickly install a payload into the trusted hardware or software. for the url version its called a URL drive by. Silent URL exploits exist too. as i can see you are a script kiddie. phishing is mediocre too u can't get a full capture. either way its not why a company hires me, they hire me to just test their employees its my job to find the right tools to aid myself in my work. don't come here and try to make it look like you know what ur saying. and what?! "or [IPv4 Address here on port so and so] 127.0.0.1:9050 is tor)" your just saying random stuff that has nothing to do with phishing/redirecting stuff doesn't need to be very complicated to work in fact in my line of work I've realised sometimes things being more straight forward and simple work more effectively. if you want to test your luck with phishing be my guest. just do not come and talk like you know what your saying, as there are people in this forum like me that do this type of stuff for a living. either way if you know of a marketplace for Odays please let me know that's if you know what a Oday is... because it looks like you just know how to phish not much else...

EDIT: Btw i love how your interested in this stuff though like I'm not screwing around here, its pretty cool learning new things so hopefully you take from this that there are such things as dangerous links. the chances of one being used on you is pretty low as their mainly used to break into multi million/billion dollar companies. :)
