Thread: [How do skids add exploits to mirai](#)

Red right hand - January 7, 2021, 5:50 am

I wanna learn how skids add exploits to the mirai framework if you have any sources on how they do this please pm me

(Please don't say skid I really wanna learn how they add them and no I won't use them I don't even own a botnet)

mrware - January 7, 2021, 6:33 am

Mirai is not a framework, but a bot.

They just modify source code to add new exploits.

They just modify source code to add new exploits.

Do they add a scanner aswell as modify the payload?

<https://github.com/R00tS3c/DDOS-RootSec/blob/master/HOW%20TO%20USE/howaddselfrep.txt>,

Here is a tutorial how to add selfrep to mirai. You probably can just find this from Youtube too.

It is done the same way, as it is done for other software that utilizes exploits. Look into exploit development and modification. Scanning is also something that should be implemented, as, let's say you target a specific firmware running on port 4040, you will want to know whether the port is open and it runs the service that you have an exploit for, before even trying to exploit it. Otherwise you would just be wasting your resources.

The hard part might be to actually get hold of exploits that will still be effective.
