Thread: [find website vulnerabilities using inspect element](#)

Ronny - January 10, 2021, 11:17 pm

Hi Guys,

How can we find vulnerabilities on a website by analyzing the code in inspect element and how to exploit them. Your help will be appreciated?. Thank guys

FlashyBeach - January 10, 2021, 11:37 pm

Step 1: Learn everything there is to know about the web and how it works

Step 2: Open inspect element

No offense but that is the fakest move.

you're literally modifying the local cached page not on the server side.

More of Step 1: Learn web development , Step 2: Create an external script that you may use to carry out attacks outside of your network.

What I said isn't mutually exclusive to what you said.

You do realise, what you are saying is just learn to code and open up a page that is yet cached on your browser then play with the code?

Firstly seems off and really not about finding XSS vulnerabilities no offense.

It's literally just saying "Oh bro, did you know that you can change information on a page using inspect element".

So yes your answer is not exclusive to mine but is highly invalid in my opinion. Therefore not wasting my time.

That's not what I said, sunshine.
