Thread: [Nanocore not working on other machines?](#)

transblackman - January 31, 2021, 4:42 am

So I've been messing around with Nanocore on my local computer and I thought it would be great idea to try it on a virtual machine (from vmware) but I installed net 3.5 and it still didn't work it didn't pop up on my nanocore dashboard but everything looked good and the RAT was running in the background of that VM machine. I've even checked my port on [canyouseeme.org](#) , and the port was opened, and dns link looks good. Can yall please help me?

Now it seems the port closed for no reason, but it still is in my Port Forwarding dashboard

So, your controller is running inside VM and bot somewhere outside your network, or inside different VM?

You will need to forward port to you VM in first case and just point bot to your internal IP (of your VM) in second case.

If u want to test on your local network do not use your ip address as host rather use 127.0.0.1 and its will work.
