Thread: [lightweight HTTP\(S\) proxy server written in C++](#)

I-GANK-I - February 23, 2021, 11:30 am

Requirements:

- Coding Language: C++
- Architecture: Both 32 bit and 64 compatible
- Operating System: Windows 7-10
- Application must be low in File Size (Max 200KB , the lower the better) . Reason: Speed
- Application must be multithreaded
- Application must be able to work with HTTPS requests
- Application Automatically elevates privileges (I can provide with a C# code for this)
- Application Automatically installs root certificate (For HTTPS)
- Application Window is Hidden by default
- Application Should clear its buffer every hour to prevent crashes (Maybe not needed)
- It should block/strip out any CORS, X-Frame and CSP headers (Before loading any of the response)
- It should append a certain HTML code into the head section (Which i can edit with my own JS/HTML code in a variable)

Note:

- Some other features can be requested at any given time, if this will be the case you will be paid for extra work. only take this order if you agree to this.

References:

- Similar project in C# : <https://github.com/justcoding121/Titanium-Web-Proxy>

Rate: \$15 / hr (Estimate 20-24 hours).
