Thread: [windows 10 randomly lagging](#)

IListenToExeFiles - March 16, 2021, 12:03 am

Hello my windows 10 machine is randomly lagging and running really slow. Malwaerbites isnt picking anything up. what should i do?

HOMODIN - March 16, 2021, 12:10 am

What are the specs? -also, if you take a look at the "reliability history" (click on the windows key and start typing it to find it) sow up any errors or crashes or anything?

It can be a driver issue, hardware issue, temp issue or almost anything at this point.

Well i have this in reliability history:

Source

Windows

Summary

Hardware error

Date

?3/?12/?2021 3:02 PM

Status

Not reported

Description

A problem with your hardware caused Windows to stop working correctly.

Problem signature

Problem Event Name: LiveKernelEvent

Code: 144

Parameter 1: 3003

Parameter 2: ffff8385c40d16b0

Parameter 3: 40010000

Parameter 4: 0

OS version: 10_0_19042

Service Pack: 0_0

Product: 256_1

OS Version: 10.0.19042.2.0.0.256.48

Locale ID: 1033

specs are:

i5-3470
16GB of ram
RX 570

Goku - March 16, 2021, 2:04 am

Seems like a hardware failure?

Maybe corrupted RAM stick.

soulm8 - March 16, 2021, 2:27 am

try it without 1 of the rams, then use another and see how its reacting.

make system backup (i like aomei backupper for that) and make a fresh install. 20h2 version works pretty nice.

He B TeMy - March 28, 2021, 7:46 am

That's a problem with one of your USB devices, nothing to do with RAM;

[Bug Check 0x144: BUGCODE_USB3_DRIVER](#)

Quote:Parameter 1 0x3003
Parameter 2 USBHUB3_LIVEDUMP_CONTEXT
Parameter 3 Reserved
Parameter 4 Reserved
Cause of Error: A USB device failed enumeration.

If you had a laptop i would ask if you have any docking station, since it's a desktop, check all your usb connectors, one of them is causing the issue, do you have any hardware that's not "standard" ?

???? - March 28, 2021, 8:44 am

Its actually simple but time consuming, no1 can tell you exactly what is it that causing PC lag. You just have to test hardware 1 by 1 and find it your self, some parts may be tricky because you don't have doubles to replace them or PC can't work w/o them. But ye that's the whole point.

pwnedcrypto - March 29, 2021, 8:11 am

Run cleanmgr.exe and clean all of your junk files. Use msconfig and remove all programs and services from startup. If you use a hard drive instead of an SSD, you may need to delete some stuff off. It is ideal to leave at least half of the drive empty. (more it is full, slower it is)

If your machine is past 5 years old as well I also consider suggesting the option of upgrading parts. The best upgrade you can make is going from an HDD to a SSD. I personally like PNY, Kingston, or ADATA for SSDs.

well check the logs and analyze it ... process hacker don't shows where resources going to ?

its highly possible its hardware fault
