Thread: [Azorult Botnet 3.3 Setup error](#)

FIVE7 - March 18, 2021, 8:15 am

hi guys. am totally confused at what is wrong and want to know if anyone else is having this issue. old times i setup it and it works ok but this recent few days , the panel seems not to be working anymore. has anyone experience this ?
i mean after complete install. i try to login and it doesn't login just return me to login page and create errors log

not sure if its the hosting but just want to know if anyone is facing this too

?BADMAN? - March 18, 2021, 8:59 am

How you call yourself a professional when you cant read a single php line ?

Obviously i am not answer something that is wrong asked since there is no code to review and also it's asked on the wrong section.

FIVE7 - March 18, 2021, 9:25 am

(Mar 18, 2021 08:39 AM)Incog Wrote: [\[CITE\]](#) It's either the php version you are using, or another dependency issue.

I'd still not use it however, because cough <https://www.exploit-db.com/exploits/47244> *cough*
yea i know. not for important usage, just for checks. i did degrade the php version even up to 7.1 and etc yet still same problem. i think i possibly mistakenly pinch a space somewhere. but i tried the new version 3.4.1 and all went ok except the builder not building the bin file.

how so useless is your reply. i said am pro in RAT setup and not botnet setup. stop acting some kiddy junkass. if you can't discuss simple solutions just skip thread. alot of botnets panels are broken, some fucked. and php versions changes at times. things change my friend.
if you are a pro you would have just speak a solution and not act silly shit.

last i remember this is botnet section and i can post issues in regards to botnet. now go fuck yourself.

How a rat is different from a botnet ?

You asking for a solution to a thing that you haven't shown and you need an answer ?

You literally asked help on some php error and that's not related to botnets as far as i know.

Some act like kids others truly are.

Some act like kids others truly are.

Not to start an argument since I do agree that proclaiming being a professional when he can't fix a php error is quite ironic but botnets and RATs (if taken by the exact definition) are two different things.

I guess you've never heard of http/php botnets.

can you stop this ? just skip ok.. i don't have time to educate you. windows application is different from php because php is a script not an app. i am pro on rat (remote administration trojan) majorly windows. not Botnets panels that are coded with different bootstrap themes and panel php configuration. this is why we have a php programmer and a coder for windows applications.

Please don't use me to learn this. do a google search. every botnet coder has a php expert that builds the botnet panel. i truly understand you don't even know what my questions is about. i already told us the name of the botnet, shown screenshot of the error message. yet you still asking bs. please skip me. am tired replying you. allow the other guys with brains to reply.

(Mar 18, 2021 11:31 AM)Incog Wrote: [\[CITE\]](#) Then dont respond.

You've said nothing of helpful value at all, and I doubt you will. Yes it is a bit ironic in what OP says he is, but that doesn't mean you should just go flame them with no want to help?

And I semi agree with you on the wrong section bit, really it should be put into the php sub forum but that doesn't mean you can't even try to help or deny its relevancy to the matter at hand.

I helped enough by stating that you need to show the piece of code that has the error in the first place.

Of course if you don't have a coding sense you couldn't realize that.

?BADMAN? - March 18, 2021, 12:05 pm

(Mar 18, 2021 11:41 AM)Incog Wrote: [\[CITE\]](#) I mean that's fair enough, [FIVE7](#) if you could show the lines of code that's causing the `_error_`, it would be helpful

"If YoU dOnT hAvE a CoDiNg SeNsE" do I look like the hacker version of spiderman I ain't got some mf 6th sense for code.

My first thought was incompatibility due to OP trying to use php7, when this version was made in what, 2018-2019? You wanna guess what a lot of web cnc's were made in at that time ?

You don't need any special hacking skills to understand that you need to review the code to see what causing the error message.

?BADMAN? - March 18, 2021, 12:41 pm

(Mar 18, 2021 12:12 PM)Incog Wrote: [\[CITE\]](#) You also don't need special hacking skills to immediately come up with common issues, one being which version is meant to be used

If it's common for you to change version of the tool every time you have errors instead of checking how they come , i will pass.

CrydBrox box never coded 3.4 but the last version was 3.3. and i don't suggest you using it because it's old and exploitable either ways I don't think it grabs from the latest version of chrome either. i suggest u get a updated stealer like redline, raccoon Taurus or anything updated

He is correct. RATs and Botnets are two different things. Although I've seen botnets that were controlled by desktop applications and RATs that had HTTP panels there's an important difference.

RATs are generally designed to enable full control over specific systems to be able to easily remotely administrate them in various fields. It's also worth noting that the majority of RATs is used for legitimate purposes, for example TeamViewer or Anydesk (even though they can be abused of course).

Botnets are almost always designed for malicious intent to hold large amounts of bots and/or run very specific attacks (e.g. stealing browser data, enabling reverse proxies, etc). Their features and functionality are limited because they have a different purpose than RATs. Also, the way they are written is very different most of the time.

Some botnets may not have some Remote Administrator Tool functionalities as you described but it doesn't mean that they don't belong to the botnet definition as a software.

I'm not sure if there's an official definition that clarifies this but there's a reason why we have two separate subforums for RATs and botnets. Of course you can say "smoke loader is a RAT designed to remotely administrate PCs" and "Imminent Monitor was a feature-rich botnet". This is maybe

correct from a pure technical perspective as you can use both tools to access remote devices, but for the majority of people in this field it would be misleading and imprecise because they associate different usages with these terms (like the OP, Adidas and me).

?BADMAN? - March 18, 2021, 2:47 pm

The definition of a botnet is the following "A botnet is a number of Internet-connected devices, each of which is running one or more bots."

It's not on my hand to explain or analyze as i am not sure the why there are separate subforums but that's not the case.

If you have any argument on why a rat is not a botnet feel free to express it.

What you said about imminent monitor and smoke loader doesn't really make any sense , smoke loader is a ddos botnet and imminent monitor is a rat botnet as from my view.

?BADMAN? - March 18, 2021, 3:31 pm

(Mar 18, 2021 03:17 PM)Incog Wrote: [\[CITE\]](#) by definition both are botnets. Like that's just a fact, both are, as you said, a number of internet connected devices, but it's more the behaviour and how they are made is what really splits them all up. It's not really accurate to look at something such as smoke loader, and then for example BitRat and say "hm yes, these are identical" because they have vastly different ways of managing and interacting with bots, and the same goes for what features they have. HTTP botnets almost always are aiming for low resource usage server wise, and high bot counts, whereas RAT's are typically for closer management of devices infected, with a smaller count. Both are, by definition botnets, but it's typical to split them up by their names, as they all (mostly) handle bots and function in different ways.

I understand your point, like end of the day they are all botnets, but it's important to see why and how they are split into different names. I'm mostly agreeing with you on the naming side, as they are all botnets, but like, yeah. Also to call smoke loader a ddos botnet is kinda unfair, it has a few modules that aren't related to ddosing, Mirai would be the best example of a ddos botnet imo, it never really went any further than ddos functions

I never claimed that different types of botnets doesn't exist , my point is that rats are of them.

Surely you can separate and name them by it's their functionalities , example a botnet that is using the bots for mining can be called mining botnet.
