Linux LKM Rootkit Tutorial | Protect Yourself From MALICIOUS LKM with rkhunter & chkrootkit | Part 3

Linux LKM Rootkit Tutorial | How To Protect Yourself From MALICIOUS LKM Rootkits | Part 3 - I show you two programs rkhunter, and chkrootkit that can help you protect yourself from MALICIOUS LKMS (Linux Kernel Modules) and Rookits (kernel space programs).

This is the end of the 3 part series in which you have been taught how to create legitimate linux kernel modules / device drivers and how to code a basic template for them and rootkit (kernel space proram). The first two parts go into creating a basic legitimate kernel rootkit application that hooks a syscall and prints some text to the console, part 3 goes into showing to scan / protect yourself from MALICIOUS kernel space/rootkit code.

NOTE_;

This is for educational purposes and is not malicious in anyway. As always this channel is mainly a coding channel to teach people how to code and what a fantastic skill it is to learn and also how to better protect themselves. My videos are purely ethical and breaking apart how these programs work and how to better protect. This channel does not condone illegal activity and nor does it show anyone how to commit malicious acts or even present enough information for persons to be able to. This channel has taught many children, and adults in schools/colleges/universitys. I have been asked to present talks at conferences and to be published as my teachings are very good and professional.
