Thread: [Shell not found 404](#)

Th3Gh0st_Ma - May 6, 2021, 11:29 am

I upload an uploader but when I try to upload shell
upload shell successfully but when I want to show I face not found 404

any solution to bypass

Stetsed - May 6, 2021, 1:31 pm

Well you would first need to know where it's getting uploaded...

Do you know the directory it's uploading into? If you're uploading to an image directory using a null byte just open an image on the site using the direct link and replace the filename and extension with your shell.

I already upload a PHP uploader it works successfully

I upload the uploader using tamper data

but the uploader is for upload security bypass because it contains a Gif; in the header

Most of decent webhost detect webshell by detecting the shellExec() commands, the files is instantly deleted on their server once uploaded.

For instance namecheap therefore I suggest you to use encrypted hand-made shell (avoir c99, Xai Syndacte or whatever is already blacklisted) or tools such as adminer.

An other information, if you try to upload a webshell on your own server, it'll also be auto*deleted.

xx

maybe you are getting blocked by the firewall so the script you are using doesnt handle it.
