Thread: [Gamblers fallacy implies gambling bots or scripts are scams](#)

JohnConnor - May 8, 2021, 11:55 pm

The gambler fallacy also known as the monte carlo fallacy occurs when someone believes a previous event makes something more or less likely to happen in a future event which is impossible and logically invalid because each event is independent of each other and have seperate odds and that means these bots/scripts for sale are complete bs. When a lot of these scripts are marketed they'll claim its an "exploit in the algorithm" but thats all misleading claims to lure ignorant buyers in. Most gambling sites use whats known as an CSPRNG and theres been zero research or evidence in people being able to break those, only shitty PRNG's like MT were breakable due to the way the math worked out. The only time I ever seen someone compromise a gambling sites outcomes was if they used a PRNG and not a CSPRNG. TI;dr: gambling scripts and bots are a scam and you will eventually lose all your money given enough time.

Yes, that's how gambling works.

Bots just streamline gambling that you could do manually. There is no difference. If you thought scripts were supposed to give you better odds in the first place then you were wrong from the start

JamesPaysDouble - May 11, 2021, 2:12 pm

You are completely correct. People advertising they can somehow help you get more from gambling are bullshitting and using the people that win as examples of their "working method".

metamorphosis - May 11, 2021, 7:45 pm

gambling scripts exist, gambling scripts that generate 'a lot of income' does not exist
