Thread: [Looking for a good walkthrough to packet sniffing/carving.](#)

laguerre2 - June 2, 2021, 7:39 pm

I haven't had an active account on this forum in years, so had to create a new one, and am looking to relearn some things I used to know.

I've got an AWUS036ACH, and Wireshark.

Is there a good guide to what I should do next? I'd especially like to know how to capture traffic on an unsecured wifi network, and then use a carving program (or whatever they're called now) to poke through and find password hashes, or even just plaintext messages. I'm using Windows, which I know doesn't help.

Hi,

I think what you're looking for is MITM (Man-in-the-Middle) attacks. Monitor mode is not really required for the job.

Here's the link to Bettercap: <https://www.bettercap.org/> . [Goodies](#) introduced me to Airgeddon <https://github.com/v1s1t0r1sh3r3/airgeddon> . Both run on Linux. Installation instructions are on the Git.

Cheers!
