Thread: [I am trying to download all images in a specific Directory on a webserver](#)

0u1law - June 20, 2021, 9:01 am

I am trying to gather all images in a specific Directory on a webserver but without to know what the name of a jpg file is

for example on [www.this.id/the/website](#) are 3 jpg files with the name 1.jpg, adkjf.jpg and 5df_df.jpg

How can i search on this specific link for all jpg files and download them on my Computer ?

I want to use Python Selenium but i have no Access to the Folder but i can look at the pictures if i have the name of the jpg files

Which modules do i need to download every single jpg file ? Any examples for me ?

Im new to this sorry if the question sounds stupid

Thanks in Advance

You'd effectively be bruteforcing it, there's no reason to use selenium.

You don't need selenium for that, you can do something like

Code import requests

from bs4 import BeautifulSoup

url = 'http://thesite.id/what/ever/'

ext = 'jpg'

def listFD(url, ext=""):

 page = requests.get(url).text

 print(page)

 soup = BeautifulSoup(page, 'html.parser')

 return [url + '/' + node.get('href') for node in soup.find_all('a') if node.get('href').endswith(ext)]

for file in listFD(url, ext):

 print(file)
