Thread: [About cyberpunk 2077.....](#)

HerdyGerdyMan - July 30, 2021, 9:07 am

So It won't be possible to run CP2077 at 4K native resolution with all of the other graphics settings maxed out and get 60 FPS for at least another 10 GPU generations?

Is Cyberpunk 2077 today, like what Crysis was back in 2007?

I have an RTX 3080 and I can't get 60fps without DLSS/quality at 1920x1080

2077 - July 31, 2021, 7:55 am

The game is just badly optimized

Kamay - July 31, 2021, 8:32 am

Wut o_o

I get 50-60 FPS at 4K with maxed settings on a 3080Ti

You get less FPS at 1080 on 3080 or TI version because its made for 4k resolution and DLSS helps alot

There's nothing wrong with DLSS and this game is designed to take full benefit of DLSS.

I have a 3090 and that can struggle at native resolutions. Cyberpunk is just difficult to run because of the sheer size of the world and the way it renders it is quite bad. The game is quite poorly optimized too.

But don't feel bad because you have to use DLSS, it's literally designed for games like this.

INCREDIBLE - July 31, 2021, 2:59 pm

that's why I'll play it on ps5. so many complaints from PC gamers.

Nate - August 1, 2021, 2:12 am

I thought people were able to get it to run smoothly now on the3080s and Shit?

Guess not

Guess not

I run it fine on a standard 2080, I don't play 4k because it's pointless for a number of reasons. I sit in the fine space of 1440p and high FPS.

wow - August 1, 2021, 3:27 am

I've run it great on my 2080S and 5900x at whatever res I threw at it. I did not however try 4k

Hilfiger - August 1, 2021, 3:38 am

I heard it runs decent on high end cards. Maybe I heard wrong? Maybe it runs better on consoles? I don't know I played this game when it came out. Beat it and grabbed my refund. It was buggy as hell.

HerdyGerdyMan - August 1, 2021, 7:50 am

On 4K/max settings without DLSS, an RTX 3090 runs CP2077 at around 7 frames per second, and heats up to over 100 °C
