Thread: [Vulnerability websites/application](#)

marenviss356 - September 9, 2021, 12:45 pm

Hello, can you tell me how: how to search for vulnerabilities (in websites / applications on win10)
how use them some guides related to this topic
how much time do you need to spend on such an attack how to keep privacy, what do you recommend, yeah i know vpn does not give you full anonymity
what should I do next when I discover a website/application vulnerability

Could someone explain to me what to do step by step to hack such a website?

I am the beginner please.

You're asking the same questions over and over.... I already gave you a good enough (in my opinion) answer [here](#) on how to begin hacking websites, but perhaps it covered concepts a tad bit too advanced for you at the moment, I can understand that. And I can't edit it anymore to make it clearer, unfortunately.

Anyhow, right now it's kinda like you wanted to be a pilot, but instead of attending flight school, you were asking how to start the plane engine. There is a time for everything.

Are you targeting website or a desktop applications? Because both are vastly different in term of exploitation and require different skills.

Then you familiarize yourself with the target technologies -- Ask yourself questions:
« What is a website? How does it works? What server application the web server is running, Apache, Nginx or other? Is it running PHP or ASP or something else? But what is PHP exactly? It's a server-side scripting language. Then perhaps I should learn it or at least know how it works. Apparently websites are often hosted on machines running Linux that are accessible using the SSH protocol... Perhaps it's possible to login to it one way or another... Let's search on the Internet!»

This is a checklist of things you do when you perform an attack

A web browser that disable javascript, tracking and cookies, and that you ONLY use for exploiting and nothing else.

And a very common user agent because it's harder to spot on the logs.

And something that you can't download : common sense. Don't be signed on your Google/Youtube (even on another browser) account while using your VPN or exploiting something.
